

Group 11 - MSU Dashboard

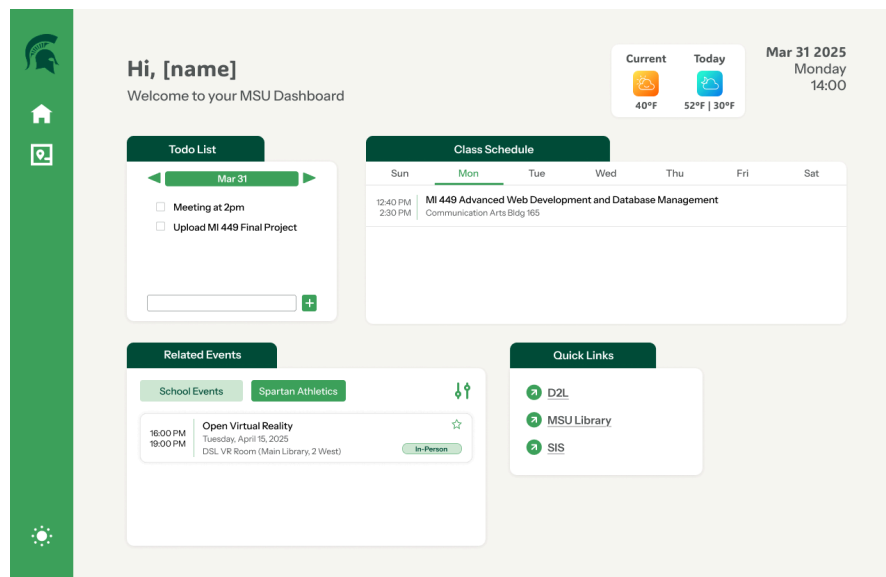

Project Statement:

Using a combination of API's and database structures, the MSU dashboard aims to provide an all-in-one front page for an MSU student. The student can sign in with Google, and from there, the dashboard will show them the current weather, the most recent sports updates, and a personal to-do list and calendar of classes. This project will draw from a combination of API's for school events, sports, and weather, and will utilize a pre-made database of the students' classes and schedule to display information.
